Research Interests: AI & Dynamical Systems

- **Dynamical Systems of AI:** Understanding AI through the lens of dynamical systems, including analyzing training dynamics of optimizers such as SGD and Adam, as well as interpreting training dynamics from the perspectives of statistical physics and neural evolution.
- **Dynamical Systems for AI:** Designing AI algorithms inspired by real-world dynamical systems, such as evolutionary computation, swarm intelligence, diffusion models, and flow matching.
- **AI for Dynamical Systems:** Solving complex dynamical system problems with AI, including simulation, prediction, and optimization (e.g., graph neural networks, physics-informed neural networks, physics-informed evolution, and more).

Research Experience

Non-equilibrium Statistical Physics & Complex Networks

Research Assistant at USTC

2021.3 – 2022.9

Advisor: Prof. Binghong Wang, Director of the Institute of Theoretical Physics, School of Physical Sciences; Head of the Theoretical Physics Division, Department of Modern Physics

- Investigated various complex network models, including the Bus Route Model (BRM), Totally Asymmetric Simple Exclusion Process (TASEP), percolation models, jamming transition models, molecular motor models, and photonic crystals.
- Analyzed these systems using statistical physics theories, with a focus on self-organized criticality and phase transition dynamics.

Evolutionary Algorithms & Machine Learning

Research Assistant at Wenzhou University

2021.9 – Present

Advisor: Prof. Huiling Chen, Dean of the School of Artificial Intelligence and Graduate School

- Investigated single-objective and multi-objective evolutionary algorithms, proposing novel methods including Escape, BBO, NDO, WOO, MORBMO, MOEBS, GNE, and DGNE.
- Applied these algorithms to diverse real-world applications such as engineering design optimization, UAV path

planning, photovoltaic parameter identification, medical feature selection, and neural architecture search.

- Research outcomes published as first author in top-tier AI conferences (AAAI, CEC) and leading AI journals (Artificial Intelligence Review, Journal of Advanced Research).

Statistical Physics & Artificial Intelligence

Bachelor and Master Student at USTC

2023.5 – Present

Advisor: Prof. Hua Tong

- Investigated structure-dynamics correlations in glassy materials and granular matter by integrating machine learning methods (graph neural networks, physics-informed neural networks) with molecular dynamics simulations, with a focus on phase transitions and self-organized criticality in glass transition and jamming transition.
- Extended research beyond physical systems by applying statistical physics perspectives to analyze the generalization, convergence, and grokking behavior of deep learning models, including Transformers and graph neural networks.
- Bachelor's thesis titled "Mechanical Self-Organization in Glass Transition Processes Based on Machine Learning" received a grade of A+.

Deep Neural Network-Based Control of Quantum Uncertain Systems

University Innovation Project at USTC

2023.3 – 2024.6

Advisor: Prof. Sen Kuang

- First proposed Physics-Informed Evolution (PIE), embedding physical constraints into evolutionary algorithms to solve control problems in quantum uncertain systems governed by the Schrödinger equation.
- Investigated three different quantum uncertain systems: state preparation in V-type three-level quantum systems, superconducting quantum circuits, and a quantum system consisting of two two-level atoms.
- Applied Kolmogorov–Arnold Networks (KAN) for quantum system control, achieving improved control precision, interpretability, and robustness compared to traditional neural network approaches.

Discovery of Metallic Glasses Driven by Large Language Models and Graph Neural Networks

University Innovation Project at Songshan Lake Materials Laboratory

2024.2 – 2024.9

Advisor: Prof. Yuanchao Hu

- Utilized large language models to extract textual information of chemical elements from Wikipedia, generating atomic feature embeddings to construct atomic material networks.
- Developed recommendation systems for binary and ternary metallic glasses using graph neural networks including TransGNN, NGCF, and GCN.
- Successfully predicted optimal two-atom pairs for glass-forming ability given single atoms, and optimal three-atom pairs given single or two atoms, achieving prediction accuracy exceeding 95% with results consistent with known experimental findings. Research outcomes published in AI for Science journal.

Surrogate-Driven Multi-Objective Evolutionary Design of Battery Phase Change Materials

Cooperation Project at USTC

2025.5 – Present

Advisor: Prof. Qiangling Duan

- As a collaborator, developed surrogate models using various machine learning approaches based on CFD simulation data.
- Integrated these surrogate models with single-objective and multi-objective evolutionary algorithms to design diverse battery phase change materials.
- The performance of discovered materials was validated both theoretically and experimentally. Research outcomes have been submitted as co-first author to multiple SCI-indexed journals.

Conference Experience

- 5th Amorphous Physics and Materials Symposium 2024, Attendee
- IEEE Congress on Evolutionary Computation (CEC) 2025, Oral Presentation

- The 40th AAAI Conference on Artificial Intelligence, Poster Presentation

Teaching Assistant Experience

- 2022, Mathematical Analysis B1, Teaching Assistant
- 2024, Mathematical Modeling, Teaching Assistant
